Ligaspan amper daar

BASF Ryderbeker volgende naweek

Heilbron se ligaspan het laasnaweek in ysig weerstoestande in Reitz gespeel, met 'n koue wind van 40 kilometer per uur. Heilbron klop vir Vrede, maar het net-net verloor teen Bethlehem 2. Die laaste liga wedstryde vind plaas op 15 September 2018 in Clarens. Dalk kan daar vir die tweede plek gespeel word. Die BASF

Ryderbeker vind volgende naweek plaas op Heilbron gedurende Vrydag en Saterdag. 20 spelers van Heilbronspan vs 20 spelers van Frankfortspan sal teen mekaar meeding.

Heilbron is tans besig om te oefen. Die gees loop hoog en dit belooft om 'n baie lekker naweek van gholf te wees.

Duiwe Nuus

Verlede Saterdag het 'n sterk noordweste wind teen die duiwes gewaai. Dit was net vir jaaroud duiwes vanaf Colesberg. Heilbron se wenduif het die 471km in 8 ure en 12 min afgelê teen 'n gemiddelde spoed van 60 kpu. Die duif het goed gedoen deur die 3de plek in die Vaal Posduifunie te behaal.

Dangers of building structures under powerlines

Eskom cares about your safety

- Why is it so dangerous to build sheds next to or under high-voltage powerlines?
A structure is registered for all power lines. For a 132 kV line the total width is 24 m from the middle of the tower or 22 m total. That will be a safe distance away. There are different minimum widths for different voltages.
A conductor might break due to strong winds or bad weather and land on a shed or a person which could kill or seriously hurt the inhabitants.
- Ideally, what distance should housing be from high-voltage power lines?
A 132 kV line the total width is 24 m from the middle of the tower or 22 m total. That will be a safe distance away. There are different minimum widths for different voltages.
- Do sheds made of metal materials pose a greater risk when built under a high-voltage line? Is there a danger of the electricity jumping or arcing to the shed?
The shed is as safe as a metal car. It is a very good conductor of electricity and yes, there is a possibility of an arc to the shed. If lightning hits the line, it often does due to the height of the tower, that lightning over-voltage might also cause a flash to the shed.
- Could people be shocked if they walk barefoot under a high-voltage line?
During very wet conditions, the power lines might cause an induced current in the ground. Although very small, the current can get the feeling of needles and pins. If a wetting line or piece of corrugated iron is because the line, a current will definitely be induced and can even kill a person.
- All powerlines are built within servitudes - what are the rules regarding building housing or sheds within servitudes?
Housing may be built in servitudes. Even high-voltage are allowed within the servitude. People staying there is definitely prohibited.
- Why can't people tap power from high-voltage lines?
A very high voltage (132 000 - 400 000 volts) is used to transport a large amount of power over a long distance. In this form, the power is too volatile and will destroy all electrical appliances in a home. It can even kill people touching these appliances. This voltage needs to be transformed to a much lower voltage (220V) so that the power can be used.
- Does an informal settlement under a powerline increase incidents of illegal connections and public safety incidents?
Illegal connections - Yes, really as the people cannot see that power at such a high voltage.
Public incidents - yes, people sometimes climb the pylons. If they touch the power lines they will die and they can fall themselves to death from the high pylons.
- How does the building of sheds under powerlines impact Eskom and municipalities?
When people build houses under power lines, the technicians are not able to access the poles which will result in customers staying without supply for an extended period of time.
